DECISION INTELLIGENCE FOR QIC GLOBAL INFRASTRUCTURE

Two layers, one machine: what each investment case assumes, and what is changing underneath it

Prepared for Andrew Sellick, QIC, following our conversation on 3 September 2026. A structure for discussion, not a proposal document.

LAYER 1 · PORTFOLIO-COMPANY LEVEL

Assumption ledger

What does this investment case need to stay true?

What it holds
Six to eight named assumptions per company, lifted from the investment case and value-creation plan: demand, pricing, regulation, counterparties, cost of capital, exit.

What happens each month
Each assumption is marked strengthening, weakening or unchanged, with dated evidence attached. No colour without a source.

Who reads it
The deal team and the asset-management lead for that company. It is their ledger; we keep it honest.

What it gives you
An early, evidenced view of which cases are drifting from their thesis, months before it shows in the numbers.

The same discipline a UK client runs today: an assumption table, tracked monthly, with the evidence for every change.

THE JOIN

1

Assumption-impact line
Every shift on the radar is mapped to the assumptions it could move. Every assumption names the shifts that could move it.

2

Unpriced-shifts register
Shifts that no current assumption covers. The gap list for the investment committee.

3

Quarterly Action Triggers
Agreed thresholds. When the evidence crosses one, a named decision goes on the agenda.

Same evidence base, both directions

LAYER 2 · PORTFOLIO LEVEL

Structural-shift radar

What is changing in the world the cases were written against?

What it holds
A small number of topics, each of four themes. For example: AI, Digital Infrastructure & Power Demand; Geopolitics, Capital & Infrastructure Sovereignty.

What happens each month
A Decision Intelligence briefing per topic (Futures Wheel, scenarios, Decide / Prepare / Monitor calls) and short Signal Scans as weak signals surface.

Who reads it
The Global Infrastructure leadership group and the investment committee. Portfolio view first, company view through the join.

What it gives you
A sourced, auditable account of the shifts that reprice infrastructure risk and opportunity, before consensus catches up.

The two examples already built for QIC sit here: the AI and power briefing, and the ownership-on-licence scan.

Due diligence uses the same machinery. A new deal's assumptions enter the ledger on day one and are checked against the radar before close. Nothing is built twice: the diligence view and the ownership view share one evidence base and one set of triggers.

A paid 12-week pilot to test the join

One topic · one portfolio company · six to eight assumptions

WEEKS 1 TO 2
Set up
Agree the assumptions with the deal team. Choose the topic. Baseline both layers.

WEEKS 3 TO 10
Two monthly cycles
Decision Intelligence briefing and Signal Scans on the topic. Ledger updated with dated evidence. First assumption-impact map and unpriced-shifts register. Action Triggers drafted with the team.

WEEKS 11 TO 12
Review
What moved, what was unpriced, what the triggers would have surfaced. Decide whether to extend.

The test is simple: did the two layers, joined, tell the deal team something they did not already know, early enough to act on?

Unlisted working document for discussion. Not for onward distribution.
